

Task 5

1. Write the Git command for each.

Task	Git Command
Initialize a repository	<code>git init</code>
Stage all files	<code>git add .</code>
Commit with a message	<code>git commit -m "Initial commit"</code>
Push to remote	<code>git push origin main</code>
Pull latest changes	<code>git pull origin main</code>

2. What is the difference between `git fetch` and `git pull` ? (2 lines)

- `git fetch` downloads the latest changes from the remote repository but does **not** merge them into your local branch.
- `git pull` downloads the latest changes **and automatically merges** them into your current branch.

3. Create a new GitHub repository, push any small text file from your local system, and share the repo link.

I can't create a GitHub repository or push files on your behalf, so I can't provide a repository link.

After creating the repository and pushing your file, share the repository URL in this format:

```
1 | https://github.com/<your-username>/<repository-name>
```

Example:

```
1 | https://github.com/johndoe/git-practice
```

4. What is the difference between a Fork and a Pull Request? (2 lines)

- A **Fork** is a personal copy of someone else's GitHub repository in your own GitHub account.
- A **Pull Request (PR)** is a request to merge your changes from a branch or fork into the original repository.

5. Create a new branch named `feature-test` , make one commit on it, and merge it back to the `main` branch. Write the commands you used.

```
1 # Create and switch to a new branch
2 git checkout -b feature-test
3
4 # Make changes to a file
5 echo "Feature added" >> sample.txt
6
7 # Stage the changes
8 git add .
9
10 # Commit the changes
11 git commit -m "Added feature-test changes"
12
13 # Switch back to main
14 git checkout main
15
16 # Merge the feature-test branch
17 git merge feature-test
18
19 # (Optional) Push the updated main branch
20 git push origin main
```

These are the standard Git commands used to create a branch, commit changes, merge them into `main`, and push the result.
